

Test Specification

Develop a RESTful API to enable reading the list of nominees and winners of the Worst Film category of the Golden Raspberry Awards.

System requirement:

- 1 Read the movies CSV file and insert the data into a database when the application starts.

API requirements:

- 1 Get the producer with the longest interval between two consecutive awards, and the one who won two awards the fastest, following the format specification defined on page 2;

Non-functional system requirements:

- 1 The RESTful web service must be implemented based on Richardson maturity level 2;
- 2 Only integration tests must be implemented. They must ensure that the data obtained matches the data provided in the proposal;
- 3 The database must be in memory using an embedded DBMS (for example, H2). No external installation must be required;
- 4 The application must contain a readme with instructions to run the project and the integration tests.

The source code must be made available in a git repository (Github, Gitlab, Bitbucket, etc).

API Format:

Description	Format
Award interval	<pre>{ "min": [{ "producer": "Producer 1", "interval": 1, "previousWin": 2008, "followingWin": 2009 }, { "producer": "Producer 2", "interval": 1, "previousWin": 2018, "followingWin": 2019 }], "max": [{ "producer": "Producer 1", "interval": 99, "previousWin": 1900, "followingWin": 1999 }, { "producer": "Producer 2", "interval": 99, "previousWin": 2000, "followingWin": 2099 }] }</pre>
